$$\frac{dV}{dt} = V(a_1 - \frac{b_1}{1000}V - \frac{c_1}{1000}H_1 - \frac{d_1}{1000}h_2 - \frac{e_1}{1000}C_2)$$

$$\frac{dH_1}{dt} = H_1(-a_2 + b_2V - c_2C_1 - d_2C_2)$$

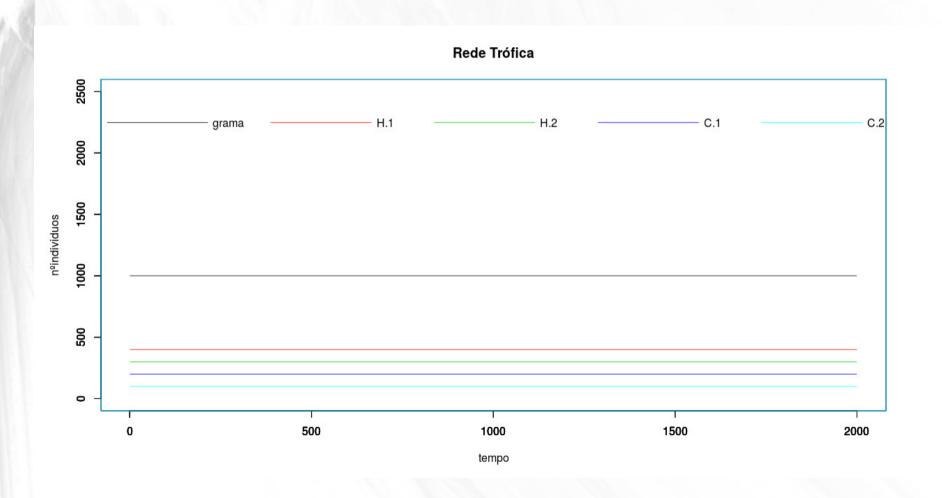

$$\frac{dH_2}{dt} = H_2(-a_3 + b_3V - c_3C_1 - d_3C_2)$$

$$\frac{dC_1}{dt} = C_1(-a_4 + b_4H_1 + c_4H_2 + d_4V - e_4C_2)$$

$$\frac{dC_2}{dt} = C_2(-a_5 + b_5H_1 + c_5H_2 + d_5C_1)$$

• O seguinte critério, no contexto do método de Euler, nos gera um sistema estático:

$$\frac{dV}{dt} = \frac{dH_1}{dt} = \frac{dH_2}{dt} = \frac{dC_1}{dt} = \frac{dC_2}{dt} = 0$$

• Todavia, na maioria esmagadora dos casos, qualquer perturbação em um sistema como esse destrói todas as espécies instantaneamente.

• Todavia, foi possível ajustar os parâmetros e estabilizar um sistema onde o segundo carnívoro é ausente.

• Partindo da situação anterior, pudemos introduzir o último carnívoro no sistema.

• Também foi possível estabilizar o sistema de tal forma que as quantidades populacionais oscilem com altas amplitudes.
